

Week2 - FPV Week 2 exercise solutions and notes

Funktionale Programmierung (Technische Universität München)

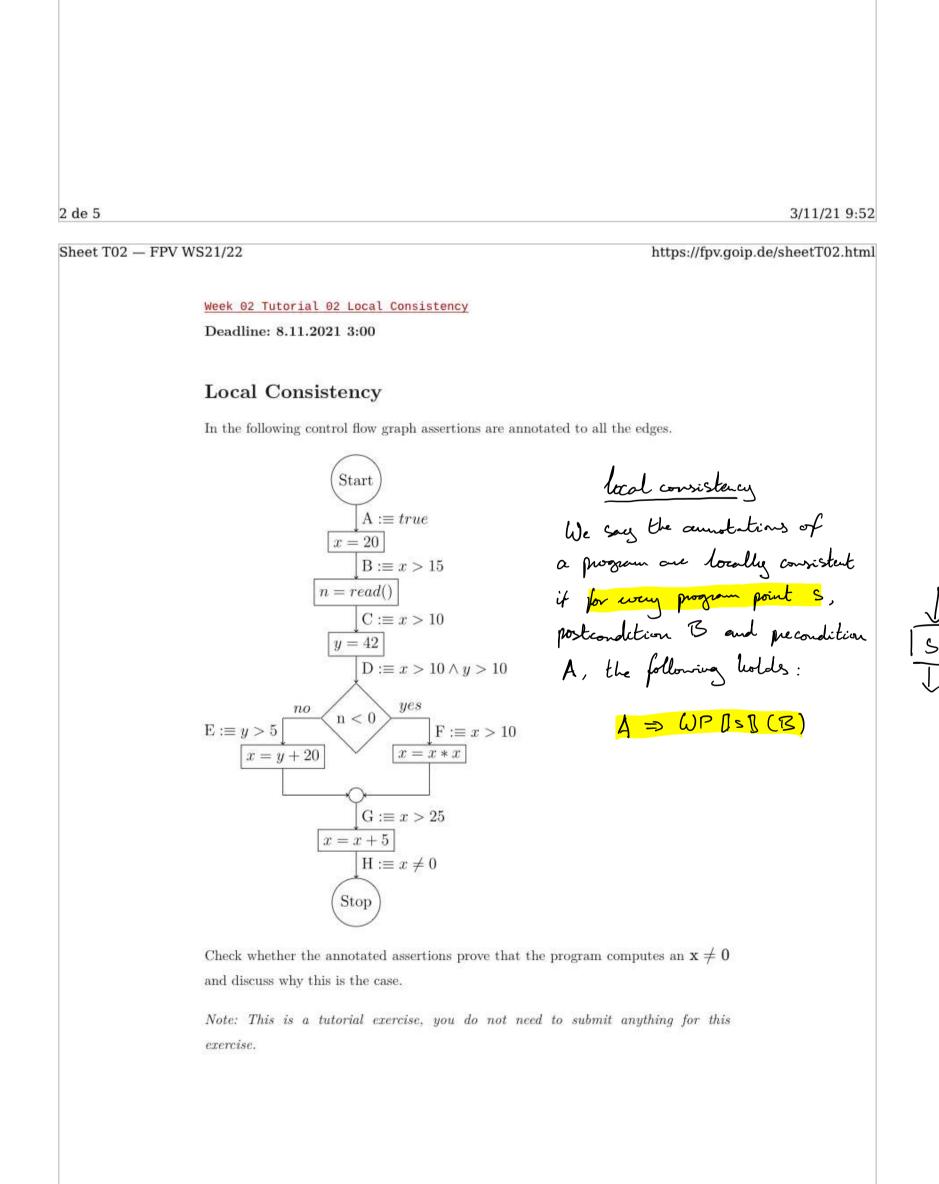

3/11/21 9:52

https://fpv.goip.de/sheetT02.html

WP [n = read ()] (D) = Vu. true = true =: E

WP [6] (B) B1) = (761 B) v (61 B1)

 $Z :\equiv x = 29$

1. For each of these graphs show whether the assertion ${\bf Z}$ holds...

Note: This is a tutorial exercise, you do not need to submit anything for this

2. Discuss advantages and disadvantages of either approach.

(a) ...using strongest postconditions and

(b) ...using weakest preconditions.

exercise.

Sheet T02 — FPV WS21/22

3 de 5 3/11/21 9:52 **Trouble Sort** 1. Annotate each program point in the following control flow diagram with a suitable assertion, then show that your annotations are locally consistent and prove that holds at the given program point. 2. Discuss the drawbacks of annotating each program point with an assertion before applying weakest preconditions, and discuss how you could optimize the approach to proving that holds.
